

# PB 25.060 D

## Heavy-duty smoothing board

The Kässbohrer smoothing board attachment is now supplied in a new version offering a number of practical advantages.

The board is of increased cross-section and wall thickness, so that rigidity is enhanced. A coil spring at the point where the two halves join makes the board more flexible when surface irregularities are encountered. In addition, the smoothing board limit stops have been enlarged and provided with extra rubber buffer blocks.

The new Kässbohrer smoothing board can be used on all existing Series 170 D trailer attachments if the pivot mountings are interchanged.

## Improved heating

A new heater matrix and altered heater pipe locations have almost doubled the output.

A two-speed blower with greatly increased airflow keeps the windshield clean and supplies air to the footwell when needed.

## Pre-heater

An electric pre-heater is now a standard fitting.

## New control valve for attachments

This modified control valve enables the front blade to be used while the smoothing board is pressed down hydraulically.
